

UPPSALA
UNIVERSITET

Introduction to Linux

By Lars Eklund

Based on work by Marcus Lundberg

- What is Linux
- Logging in to UPPMAX
- Navigate the file system
- “Basic toolkit”

UPPSALA
UNIVERSITET

What is Linux

- The Linux Operating system is a UNIX like UNIX compatible Operating system.
- Linux is a Kernel on which many different programs can run. The shell(bash, sh, ksh, csh, tcsh and many more) is one such program
- Linux has a multiuser platform at its base which means permissions and security comes easy.

UPPSALA
UNIVERSITET

Many Flavours

CentOS

debian

slackware

l i n u x

Scientific Linux

UPPSALA
UNIVERSITET

Connect to UPPMAX

- (Download XQuartz or other X11 server for Mac OS)
- **Linux and MacOS:**
 - start Terminal
 - **\$** `ssh -X username@rackham.uppmax.uu.se`

```
User Guides: http://www.uppmax.uu.se/support/user-guides
FAQ: http://www.uppmax.uu.se/support/faq

Write to support@uppmax.uu.se, if you have questions or comments.

Active notices for rackham:

Issues with Crex
http://status.uppmax.uu.se/2021-01-15/crex/

Uquota incorrectly reports quota in some cases
http://status.uppmax.uu.se/2020-10-12/uquota/

Please remove unneeded data in your project directory
http://status.uppmax.uu.se/2020-01-20/crex-no-space-left-on-device/

(Mon Jan 18 23:48:36)[laek1991@rackham1 slask]$
```

UPPSALA
UNIVERSITET

Connect to UPPMAX for windows users

- Download a X-server such as GWSL or X-ming or VcXsrv or an other of your choosing
- Install WSL and a Distribution such as ubuntu or a ssh program such as MobaXTerm
- Connect to `$ ssh -X username@rackham.uppmax.uu.se`

Windows links

- <https://sourceforge.net/projects/vcxsrv/>
- <https://mobaxterm.mobatek.net/>
- <https://opticos.github.io/gwsl/>
- <https://sourceforge.net/projects/xming/>
- <https://docs.microsoft.com/en-us/windows/wsl/install-win10>
- Don't forget to update to wsl2

X11-forwarding graphics from the command line

- Graphics can be sent through the SSH connection you're using to connect
 - Use `ssh -Y` or `ssh -X`
- MacOS users will need to install XQuartz.
- When starting a graphical program, a new window will open, but your terminal will be “locked”.
 - Run using `&` at the end to run it as a background process e.g. “`gedit &`”
 - Alternatively, use `ctrl-z` to put `gedit` to sleep and type `bg %1` to make process number one run in background

Command line with bash

- The command-line interface: the bash prompt 
- **bash** is a program finds and runs other programs
- **bash** is scripting language that is referred to as a shell
(because it sits around the kernel making it easy to interact with)

The prompt

[info]\$ **program** **word1** **word2** **word3**

- **[info]** is configurable, and usually tells you who you are, on what system, and where in the file system
- The **program** to run is the first word
- All words are separated by spaces

Program, flags, and files

- Output:
 - Most Linux programs output to the terminal
 - Some also write to files
- Input:
 - Flags: specific single letters or words that change the behaviour of a program
 - Arguments: text given to the program when started, e.g. file names.
 - Terminal input: text given to the program while it runs

Example bash command

```
$ mv -v inbox/* outbox/
```

```
'inbox/data1.dat' -> 'outbox/data1.dat'  
'inbox/data2.dat' -> 'outbox/data2.dat'  
'inbox/data3.dat' -> 'outbox/data3.dat'
```

Program

Flags

Argument 1

Argument 2

Output

Tab Completion

- Whenever you're writing a path or filename on the bash prompt, you can strike the 'tab' key to ask Bash to complete what you're writing
- Get in the habit of this — it will save you many hours

UPPSALA
UNIVERSITET

Editing files

- File/text editors :
 - **nano** (keyboard shortcuts shown on-screen)
 - **gedit** (graphical, needs X11)
 - **vim** (fast and powerful, once you learn it)
 - **gvim** vim with a GUI, lots of features very Fast
 - **emacs** (fast and powerful, once you learn it)(set to xemacs on rackham which has a GUI)
- Try them out and pick one.

Sources of error

- **Capitalisation** matters in file names and program names
- **Spaces** matter. Always have a space after the program name. Don't add spaces in file names.
- Check that you are in the **right place** in the file system.
- **File permissions**. Check that the right **read, write and execute** permission are set

UPPSALA
UNIVERSITET

Caution!!

- Some words of warning:
 - There is **no undo** for cp, mv, and rm.
 - **Beware** of overwriting (clobbering) files and deleting the wrong ones.
- If you do destroy your data, email UPPMAX support, we **may** be able to help

UPPSALA
UNIVERSITET

Thank You for Your attention

NOW STARTS THE CODE ALONG

Remember: **Capitalisation** matters and so do **SPACES** “ “
and there are **NO** do-overs

Therefore it is good practices to work on copies of your data and keep
your data write protected which we will teach you how to do

UPPSALA
UNIVERSITET

Let's get wild with Wildcards

- `$ ls many_files`
- `$ ls many_files/*.txt`
- `$ ls many_files/file_1*1.docx`
- Want to clean out temporary files ending in `.tmp` in all the subdirectories?
 - `$ rm */*.tmp`
(could be wise to do `ls -a */*.tmp` first to see what will be deleted...)
- **Exercise:**
 - Create a new directory and move all `.txt` files in `many_files` to it

Reading files

- In Linux, you can display files without being able to change the
 - `$ cd old_project`
 - `$ ls`
- Hmm, which of these files are useful?

```

File permissions

- **r** – read
 - Files: Read the contents of the file
 - Directories: List the files in the directory
- **w** – write
 - Files: Modify the file
 - Directories: Add, rename, or delete files in the directory
- **x** – execute
 - Files: Run the file as a program
 - Directories: Traverse the directory (e.g. with “cd”)

Changing permissions

- **chmod**
- Files with **w** can be modified and destroyed by accident. Protect your input data!
- If you want to share data or scripts with a person not in your project (e.g. support staff like me), you can!
- If you want to keep non-members from even seeing which files you have, you can!

```

Change file mode

- **chmod** <mode> <files>
- <mode> can be e.g.
 - u+x (let you run a script you just wrote)
 - -w (no write permissions for anyone)
 - g+rw (let group members read and edit this file)
 - g=xw (let group members go into your directory and put files there, but not see which files are there)
- **chmod** takes flags as usual, e.g. -R for recursive

chmod – numerical permissions

- Online, you will come across e.g. “**chmod 755**”, what does this mean? It’s a “bit mask”:
 - $7 = 4 + 2 + 1 = r + w + x$
 - $5 = 4 + 0 + 1 = r + x$
- What number would $r + w$ be?

```

chmod — Hands-on

- In the `linux_tutorial` directory, find important files and old saved data that you wouldn't want to lose.
 - Directories: `important_results/`, `old_project/`
 - File: `last_years_data`
- Use `chmod` to remove write permission from those files and directories (use the `-R` flag to also do the files in the directories).
- Take a moment to play around with `chmod` and explore the effects of permissions on files and directories.

Now try this

Review exercise:

- Now try this:
 - Create a new directory inside your home directory
 - Cd into it
 - Copy any file into the directory
 - Rename the file to something else
 - Delete the directory and its contents

Summarising exercises (1)

- Find and delete the files named temp_file-1 and temp_file-2.
 - Can you do it with one command, standing in linux_tutorial/?
 - You may have to give yourself permission.
